

CCA Basic Training - Forage Crops

Presenter: Sid Bosworth
University of Vermont Extension

Credit: Jerry Cherney
Cornell University

Handout Orientation!

CCA Basic Training - Forage Crops

National Exam:
Sections related to forages,
but appear to be very Brief.

Northeast Regional Exam:
More forages than national.
Specific examples for NYS.

8 CCA Competency Areas

1. Crop Adaptation
2. Tillage Systems
3. Seeding Factors
4. Seeding Rates & Row Spacing
5. Replanting Decisions
6. Staging, Growth & Development
7. Forage Harvesting Factors
8. Cropping Systems

(37 Performance Objectives) 1

Primarily Dairy forage in Northeast

Variable soils
High quality forage

1 Soil pH influences:

- A. Species selection.
- B. Nitrogen fixation.
- C. Element availability..

1 Recommended pH Ranges

Clovers 6.0 – 6.8
Perennialgrasses 5.6 – 6.8
Alfalfa

1 Soil Drainage influences:

- A. Species selection.
- B. Persistence of perennials.
- C. Water requirements..

3 Climatic Adaptation of Forage Crops

CCA Basic Training - Forage Crops

National Exam:

Sections related to forages,
but appear to be very Brief.

Northeast Regional Exam:

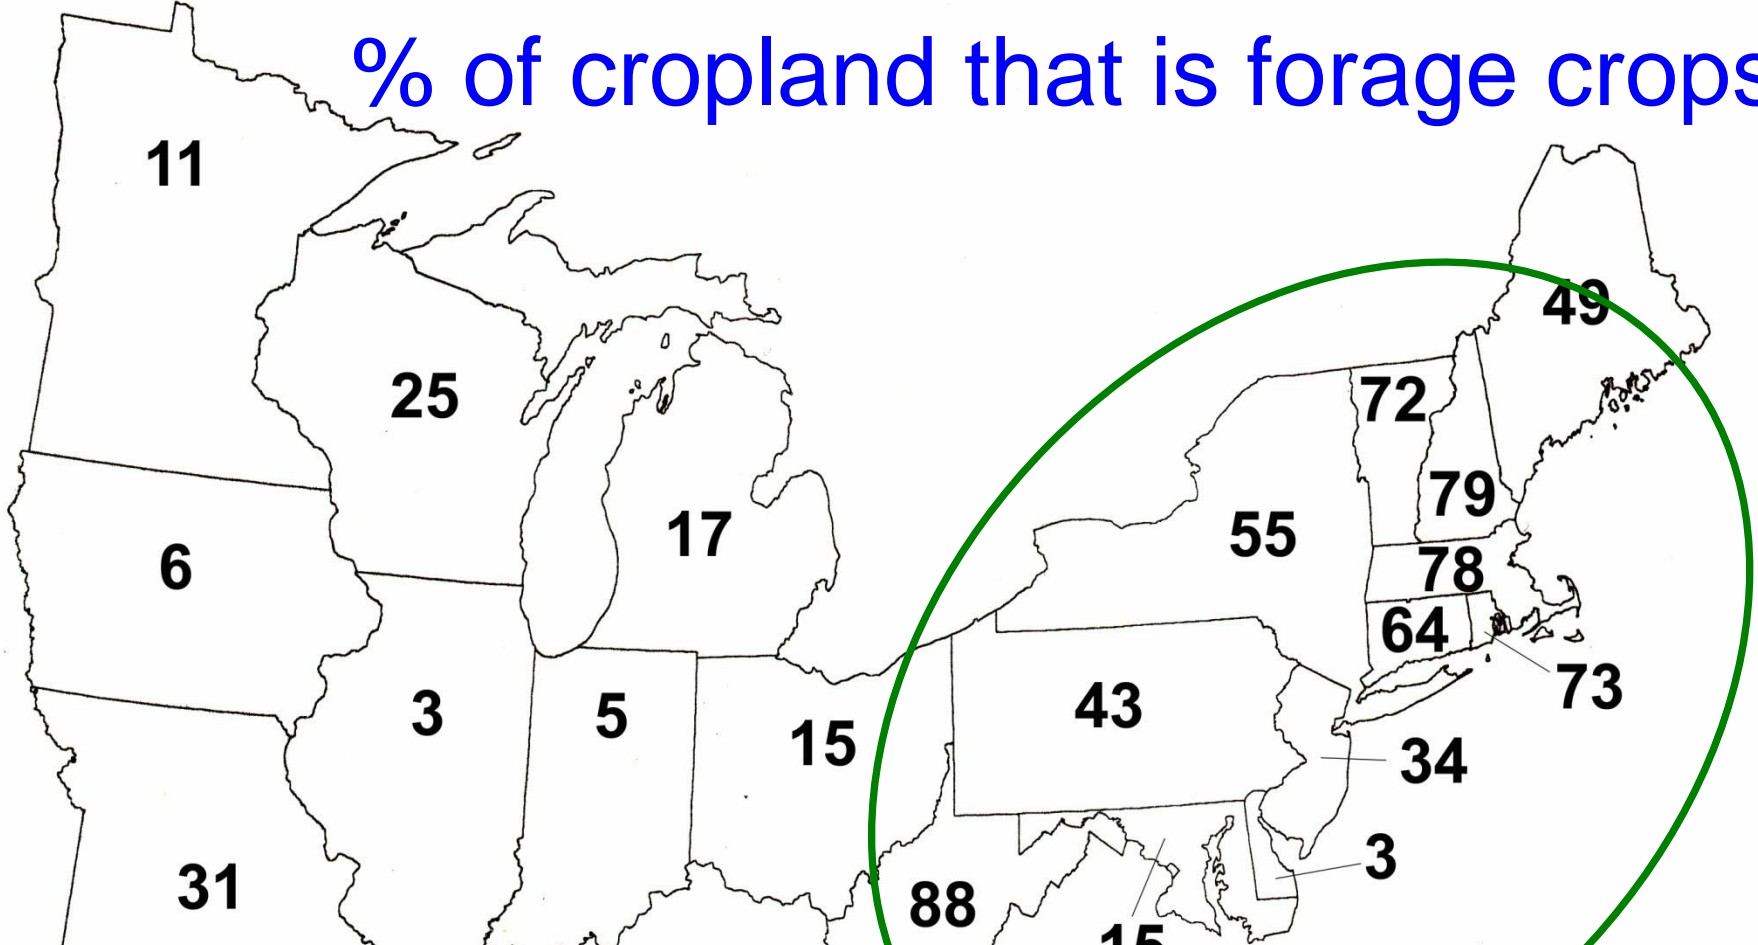

More forages than national.
Specific examples for NYS.

8 CCA Competency Areas

- 1. Crop Adaptation**
- 2. Tillage Systems**
- 3. Seeding Factors**
- 4. Seeding Rates & Row Spacing**
- 5. Replanting Decisions**
- 6. Staging, Growth & Development**
- 7. Forage Harvesting Factors**
- 8. Cropping Systems**

(37 Performance Objectives)

% of cropland that is forage crops

Primarily Dairy forage in Northeast

Variable soils
High quality forage

1

Soil pH influences:

A. Species selection.

B. Nitrogen fixation.

C. Element availability..

1

2

Recommended pH Ranges

Clovers 6.0 – 6.8

Perennial grasses 5.6 – 6.8

Alfalfa

1

Tolerance to Wet Soils

Reed Canarygrass

Meadow Fescue

Tall Fescue

Smooth Bromegrass

Orchardgrass

Timothy

1

Soil Drainage influences:

A. Species selection.

B. Persistence of perennials.

C. Water requirements..

3

Climatic Adaptation of Forage Crops

Moisture and
Drainage classes

Reed canarygrass
tolerates very wet to droughty

3

WL355RR

HarvXtra

2016 seeding
Interaction of cultivar and drought

3

HarvXtra Air Seeding, northern NY, Spring, 2016

3 Drought + high temp. => hastens flowering
4 but drought increases leaf:stem ratio.

4 Temperature Issues – Low temp.

Delays reproductive development.
Decreases the water requirement.
Delays forage quality decline.
Frost will reduce forage quality.

4

Persistence Issues - Alfalfa

Stand Age

Variety

Soil pH

Soil K

Soil drainage

Fall Soil moisture

Harvest frequency

Stubble height after last harvest

Heaving

9

Seeding Factors – Ideal Seedbed Conditions

Smooth
Firm
Free of clods
Some residue

Footprint in seedbed no more than 1" deep.

Seedbed Preparation

Fine, Firm and Smooth

Excess amount
of large clods

Too fluffy

- Drainage tolerance
- Winter hardiness
- Disease resistance
- Yield and quality
- Recovery rate

How do we select Species & Varieties?

12

Species Selection Program on WWW

www.forages.org

Need to match species to the site.

In PA:

http://www.forages.psu.edu/selection_tool/index.html

12 Species selection is based on primarily on soil drainage, but also is use-specific.

12

Species Selection Program

Select soil type.

Select hay/silage or pasture use.

Select Animal type:

Dairy, Sheep, Beef, Horse

**Site-specific, Use-specific forage
species recommendation is provided.**

Soil Type: Palms

Recommended for Lactating Dairy Pasture:

<u>Species</u>	<u>Tons/acre</u>	<u>Pounds DM/acre/month</u>					
		<u>May</u>	<u>Jun</u>	<u>Jul</u>	<u>Aug</u>	<u>Sep</u>	<u>Oct</u>
Reed canarygrass	2.1	915	1098	549	366	549	183

(Reference corn yield is Grain, 60 bu/a, Silage, 10.2 tons)

12 Soil Type: Palms (Optimum artificial drainage)

Recommended for Lactating Dairy Pasture:

<u>Species</u>	<u>Tons/acre</u>	<u>Pounds DM/acre/month</u>					
		<u>May</u>	<u>Jun</u>	<u>Jul</u>	<u>Aug</u>	<u>Sep</u>	<u>Oct</u>
Reed canarygrass	4.4	1936	2323	1162	774	1162	387
Orchardgrass	4.4	2323	2323	774	774	1162	387
Orchard/Ladino	2.8	1342	1541	845	497	497	249
Timothy/Ladino	2.6	1140	1369	684	456	684	228
Timothy/Brome/Ladino	2.9	1260	1512	756	504	756	252
Timothy/Reedcanary/ Ladino/Alsike	3.0	1490	1703	798	532	532	266

(Reference corn yield is Grain, 150 bu/a; Silage, 25.5 tons)

Factors that influence species selection: Grass Species

12

Ease of Establishment

Timothy

Orchardgrass

Tall Fescue

Meadow Fescue

Smooth Bromegrass

Reed Canarygrass

12

Regrowth Potential

Tall Fescue

Orchardgrass

Meadow Fescue

Reed Canarygrass

Smooth Bromegrass

Timothy

Timothy

All cool season grass species respond well to N fertilizer

- ➡ Shallow root system
- ➡ Low K content.
- ➡ Not drought tolerant.
- ➡ Persistent, easy to establish.
- ➡ Noncompetitive grass.
- ➡ Lower in protein than other grasses..

Smooth bromegrass

- ❏ Winter hardy.
- ❏ Early spring grazing.
- ❏ Tolerates hot, dry conditions.
- ❏ Damaged by harvest during stem elongation..

Reed Canarygrass

- ☞ Weak seedling.
- ☞ Adapted to wet & dry areas.
- ☞ Tolerates low pH and fertility.
- ☞ Need low-alkaloid variety..

Orchardgrass

- ☞ Withstands close grazing, but....
- ☞ Very competitive with legumes.
- ☞ Matures earlier than other grasses.
- ☞ High K content if soil K is available..

Sparse-flowering orchardgrass germplasm (started in 1998 in Wis.)

Cultivar to be
released in
2017 or 2018.

Sparse-heading
OG-alfalfa

Normal OG-Alfalfa

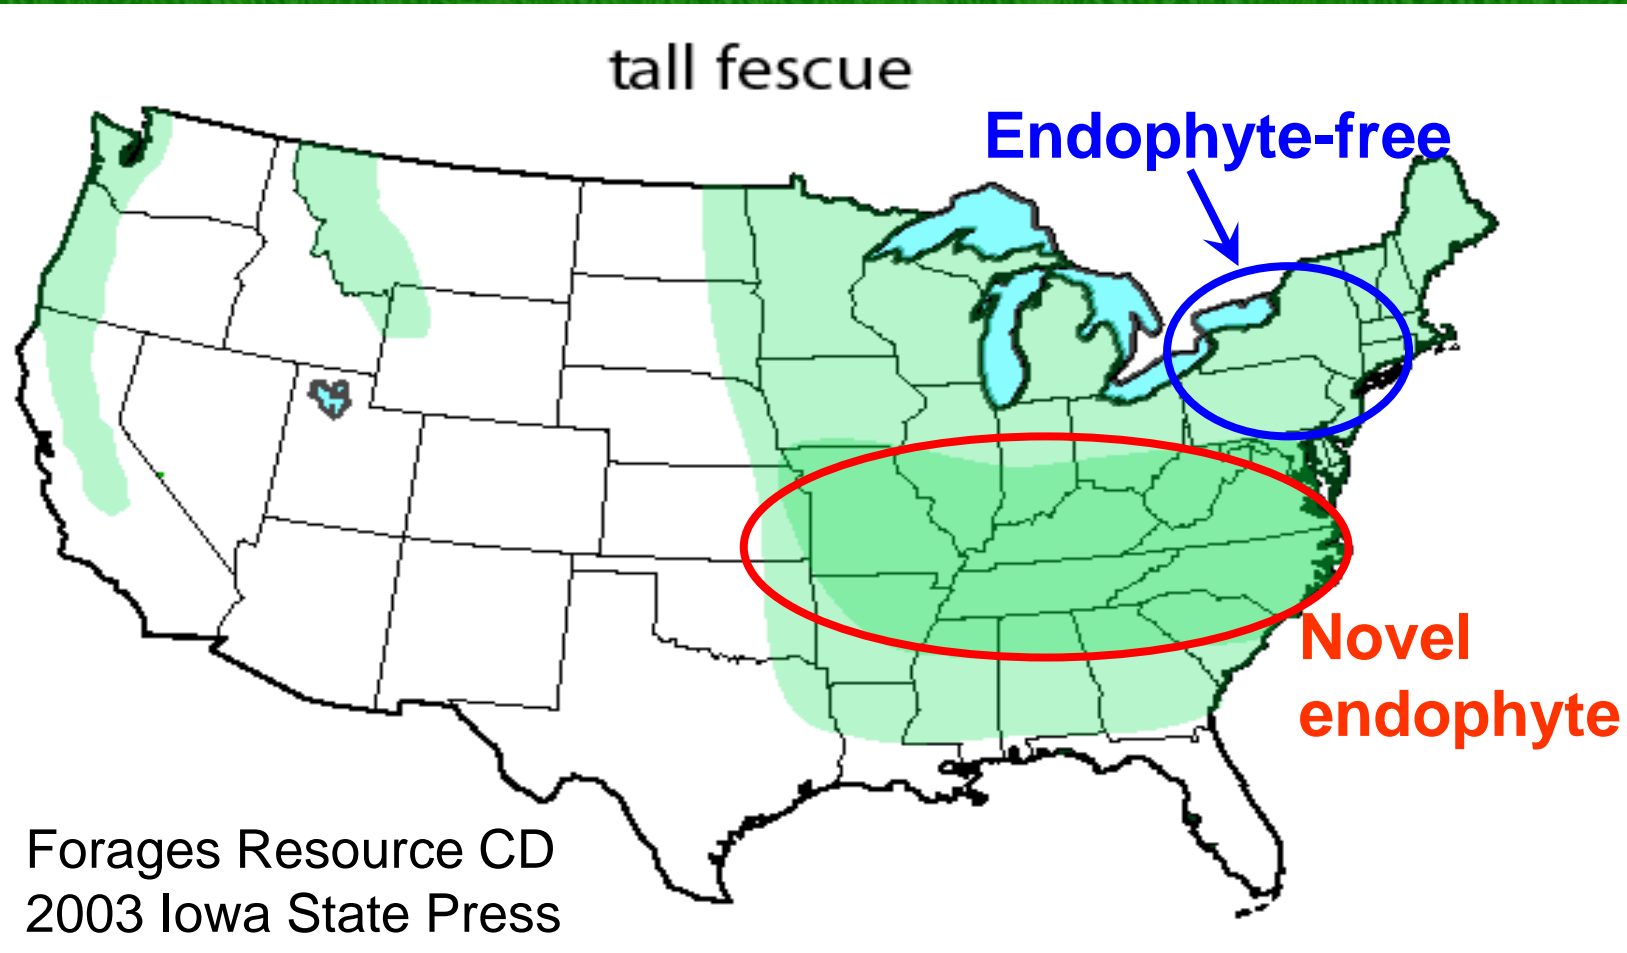

Tall Fescue

- ☞ Withstand heavy traffic.
- ☞ Need low-endophyte variety.
- ☞ Establishes easy.
- ☞ Regrowth good..

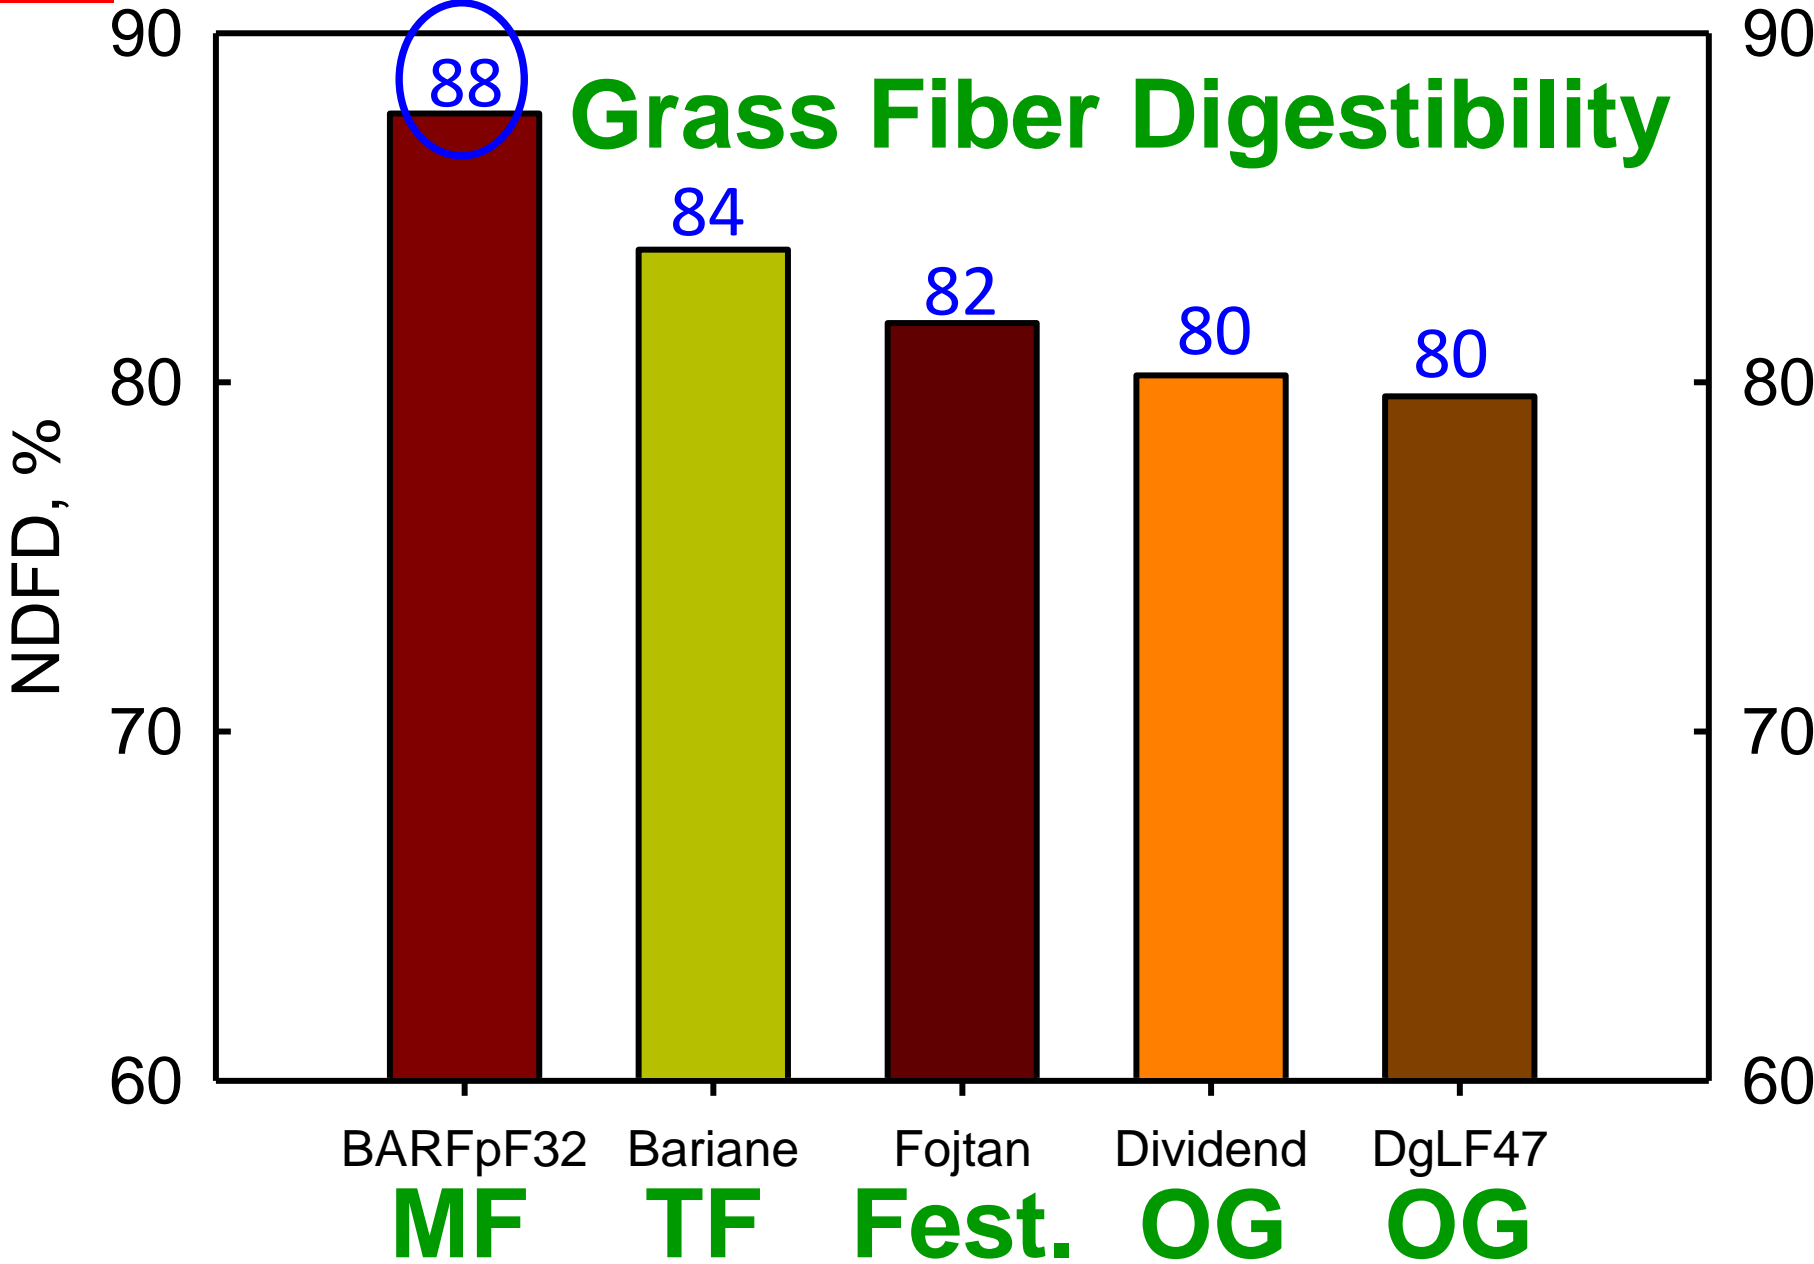

12

Novel Endophyte was developed to fight stress: drought in the mid-South USA, and insect predation in NZ/Australia.

Meadow Fescue

- ➡ Establishes easy.
- ➡ Not susceptible to TF endophyte.
- ➡ Tolerant to acid/poorly-drained soils.
- ➡ Tolerant to close grazing.
- ➡ Lower yielding than tall fescue.
- ➡ Higher forage quality than others.
- ➡ Very winter hardy..

Grass seed sold in NY (estimate)

13 Time of Seeding (Region-specific)

Spring Seeding

As late as mid-May for grasses
and early June for alfalfa.

Too early:
Cold, wet soils

Too late:
Multiple stresses
Temperature
Moisture
Weeds

13 Time of Seeding

Late Summer

As late as late August for grasses
and mid August for alfalfa.

Too early:
Hot and dry

Too late:
Insufficient time
to establish.

13 Time of Seeding

Frost seeding

Seeding prior to the onset of spring soil freeze-thaw cycles.

Cheap & Easy
Red clover

Higher risk of failure.

Reed canary,
BFT: Don't do it.

15

Factors Affecting Seeding Rate

Seed size

Pure Live Seed (PLS)

Soil type

Seedbed condition

Seeding method

PLS = germination x purity
 $0.95 \times 0.97 = 92\% \text{ PLS}$

Recommended Seeding Rates

Species

Alfalfa

lbs/a

12-15

Perennial grass

10-14

Mixtures

Alfalfa

10-12

+Perennial grass

3-6

18

Pure Alfalfa

Well drained soil.
Ability to use weed control (RR-alfalfa).
Yield & persistence on good land..

Pure Grass

Not optimum land for alfalfa.
Better manure management options.
Expand the spring harvest window.
Good yield if fertilized..

Alfalfa-grass mixtures

Reduce potential for alfalfa heaving.
Eliminate need for commercial N.
Grass will fill void left by alfalfa decline.
Alfalfa-grass is higher yielding.
Alfalfa-grass can produce as much
milk as pure alfalfa..

18

Alfalfa acres sown with grass

Mixed Alfalfa-Grass Stands

1. Ideal forage for lactating dairy cattle.
2. A Northeast USA phenomenon.
3. Manage like alfalfa if $>50\%$ alfalfa.
4. Manage like grass if $<50\%$ alfalfa.
5. Optimum spring harvest is after pure grass and before pure alfalfa.

19

Recommended Seeding Depth

Species

Soil type

Soil moisture

Time of seeding

Firmness of seedbed

Roughly 0.2 to 0.5 inch depth.
Deeper if moisture stress.

Environmental Stress - Risk of Alfalfa Winter Injury

Stand age.
Winterhardiness & Disease resistance.
Soil pH and K level.
Soil drainage.
Soil moisture during fall/winter.
Harvest frequency.
Fall stubble left.

**Mean Stage
by Weight (MSW)**

Crop Staging – Alfalfa Staging System

Mean state by count

Vegetative (0-2)

Bud (3-4)

Flowering (5-6)

Seed (7-9)

10 stems (Stage 3)

25 stems (Stage 4)

6 stems (Stage 5)

$$MSC = \frac{(10*3)+(25*4)+(6*5)}{(10+25+6)} = 160/41 = 3.9$$

25

Perennial Grass Staging System

Continuous index

Germination (0-0.9)

Vegetative (1.0-1.9)

Elongation (2.0-2.9)

Reproductive (3.0-3.9)

Seed Ripening (4.0-4.9)

Stage designation (e.g. G0) and an index No.
MSC calculated like alfalfa MSC.

27

Growing Degree Days (different from corn)

Base 41° F

e.g. Max 74 F, Min 40 F, $((74+40)/2) - 41$

5 consecutive days above 41 F.

Harvest and Forage Quality

A wide-angle photograph of a lush green field of tall grasses. In the background, a red tractor is visible, moving through the field. The sky is overcast, and a few birds are seen flying in the distance. The grasses are dense and appear to be a warm-season species.

Warm-season grasses:
Very poor forage quality

Remainder will deal with cool-season species.

K content (lowest to highest)

Timothy

Smooth Bromegrass

Reed Canarygrass

Meadow Fescue

Tall Fescue

Orchardgrass

Luxury consumption.

Assuming normal exchangeable soil K.

CP content (lowest to highest)

Timothy

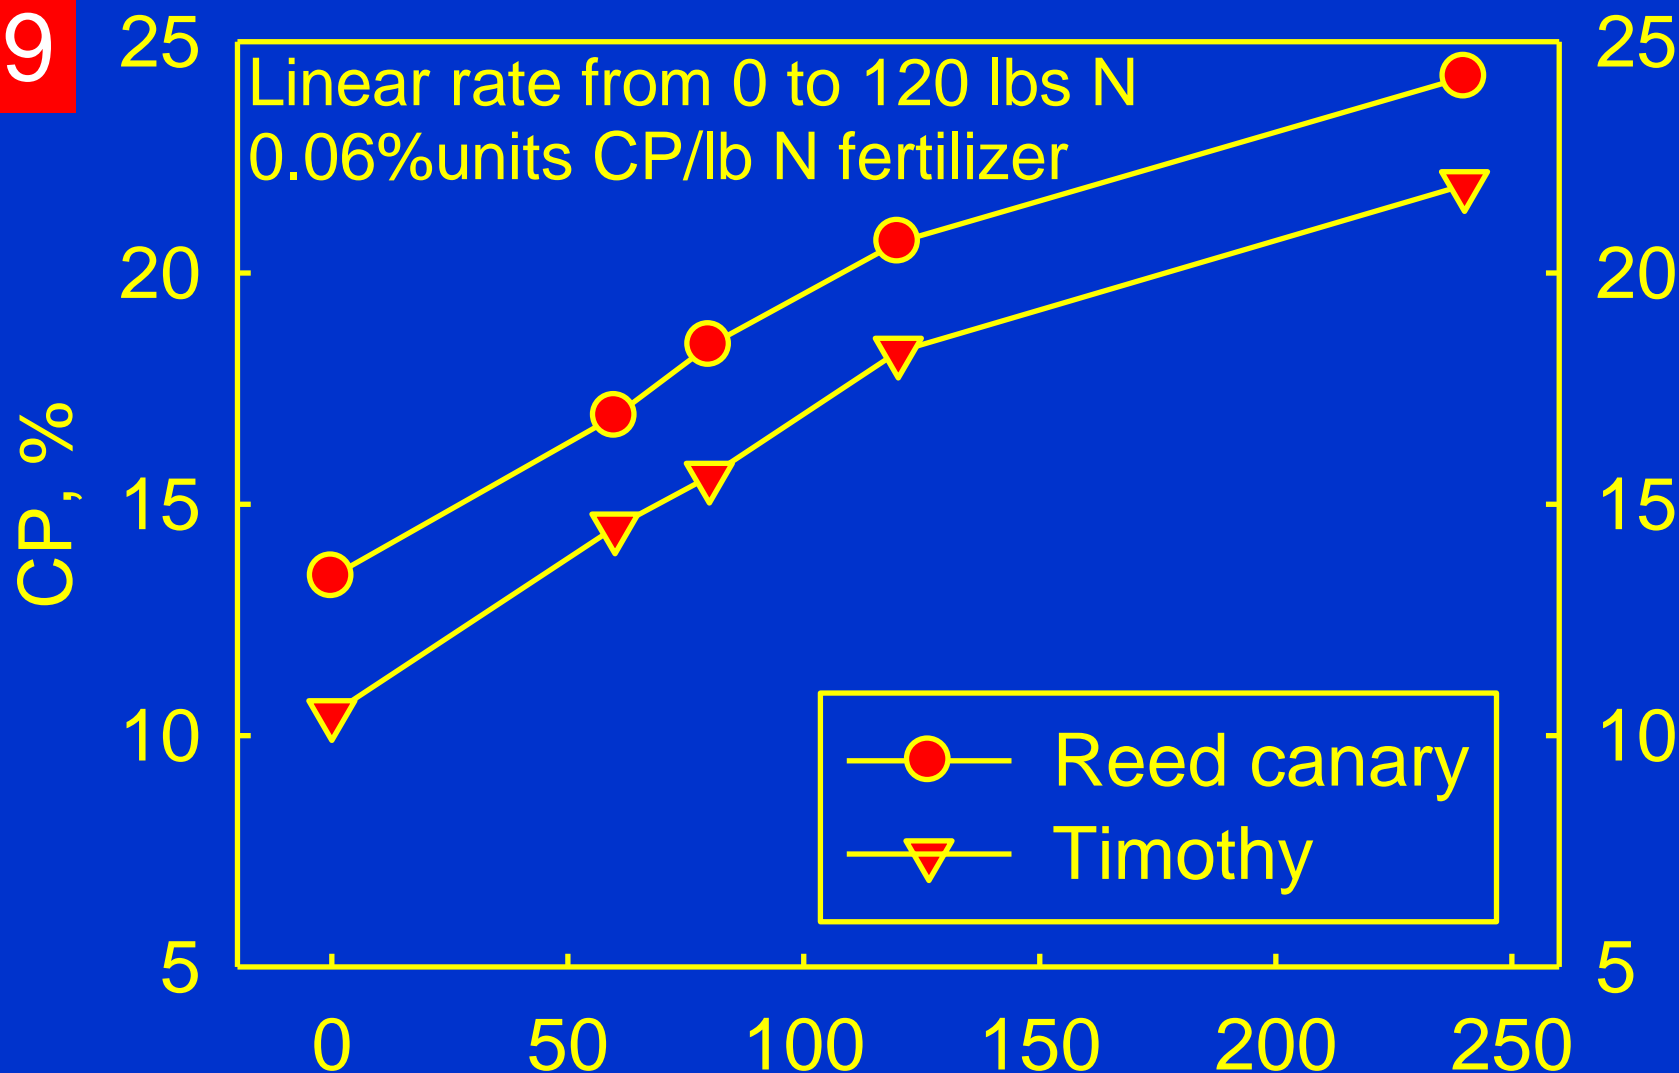

Tall Fescue

Meadow Fescue

Smooth Bromegrass

Reed Canarygrass

Orchardgrass

Spring N application, lbs actual N/acre

Reed canary is 2.5% units higher in CP.
(Average of 3 sites, 3 years, 4 reps)

Forage

Meets effective fiber needs of a dairy cow (when fed as the primary forage source in the diet).

NDF = Neutral Detergent Fiber

Optimum Quality

Alfalfa NDF = 38-42% (hay)
43-47% (silage)

Grass NDF = 50-55%

Alfalfa CP = 18-19%

Grass CP = 17-18%

DairyOne Forage Laboratory

Long-term averages

Grass Hay

10% CP, 65% NDF

Legume Hay

20% CP, 41% NDF

29 Sampling is the largest source of variation in the analytical process.

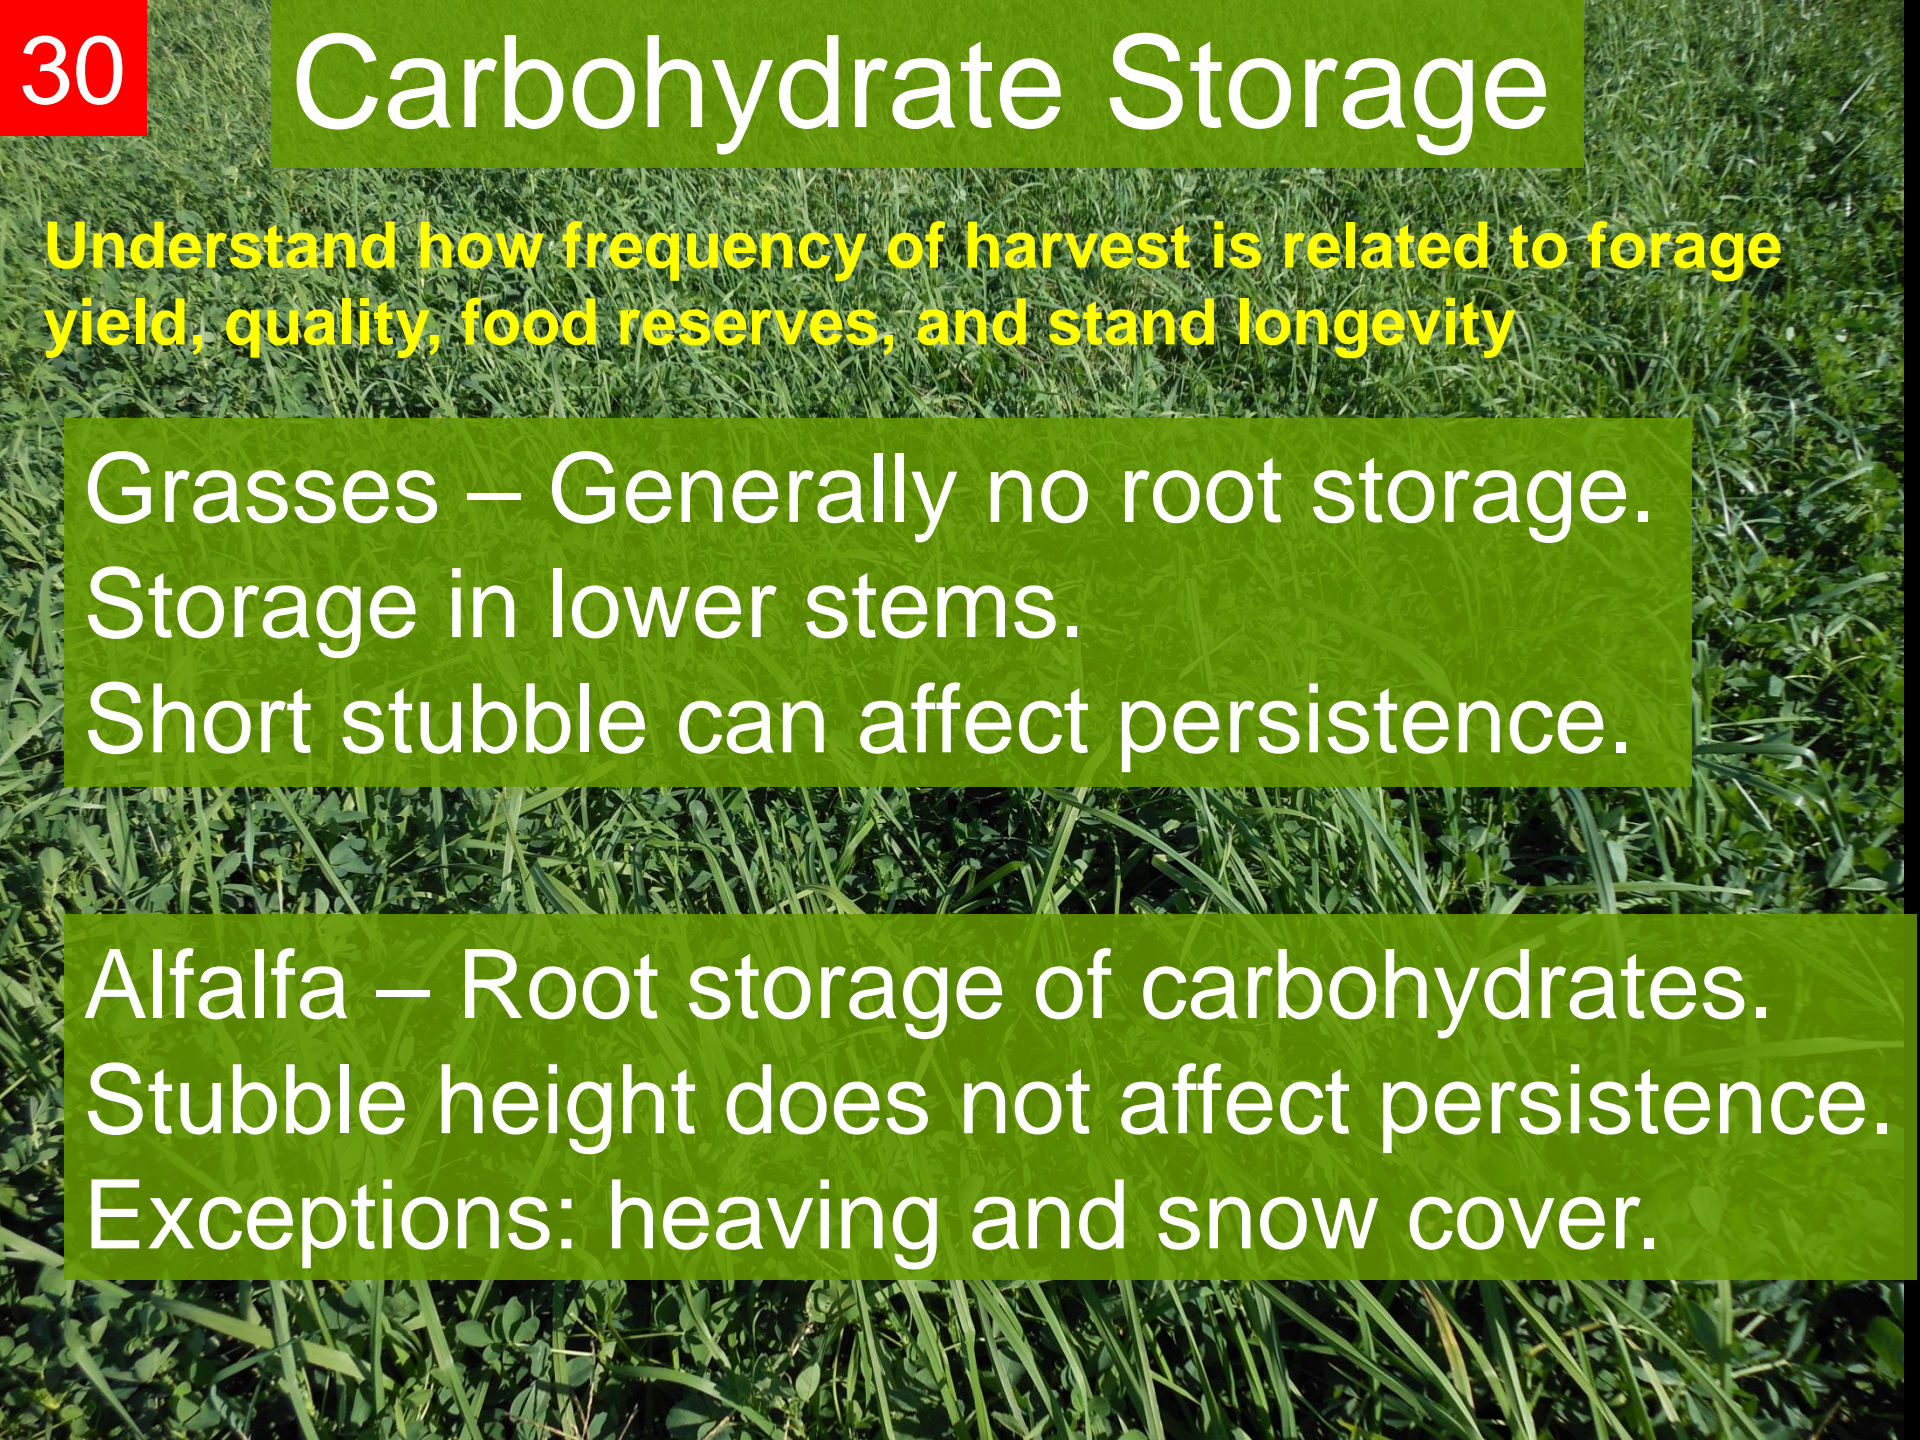

29

Mixed Grass-Legume Stands

Spring harvest based on NDF

www.forages.org

Carbohydrate Storage

Understand how frequency of harvest is related to forage yield, quality, food reserves, and stand longevity

Grasses – Generally no root storage.
Storage in lower stems.
Short stubble can affect persistence.

Alfalfa – Root storage of carbohydrates.
Stubble height does not affect persistence.
Exceptions: heaving and snow cover.

A close-up, high-angle shot of a dense, lush green field. The vegetation consists of various types of grasses and low-growing weeds, creating a complex, textured surface. The colors range from vibrant lime green to deeper forest green. In the center of the image, a solid green rectangular box is superimposed, containing the words "THE END" in a bold, white, sans-serif font. The text is centered both horizontally and vertically within the box.

THE END
